

Project Fly

Deepak Adhikari (68018)

Kshitiz Tiwari (68035)

Problem statement

- Although Bluetooth is simple to use, it has disadvantage of slower file transfer rate
- Access Point, AdHoc still complex
 - Access Point is not available everywhere
 - Hotspot and AdHoc is still difficult to configure for normal users
- Lacking application that delivers simplicity of bluetooth and performance of WiFi

Introduction

- Newer approach to share files between laptops
- Simplicity of bluetooth
- Performance of Wi-fi

Objectives

- To make file transfer between laptops simpler
- To develop an application that gives intuitive user experience to share file
- To make user friendly environment for establishing connection between laptops

Features

- Easily establish connection between two laptops
- Easily share files between laptops
- Application has both GUI and CUI
 - Seamlessly works across GUI and CUI

Methodology

- Could not follow product oriented software development
- Classified our work into four phase
 - Socket study / implementation
 - Study of Wi-Fi Direct
 - Implementation of Wi-Fi Direct
 - Integration of Wi-Fi direct and Socket

System Design

Program Flow

Sending file

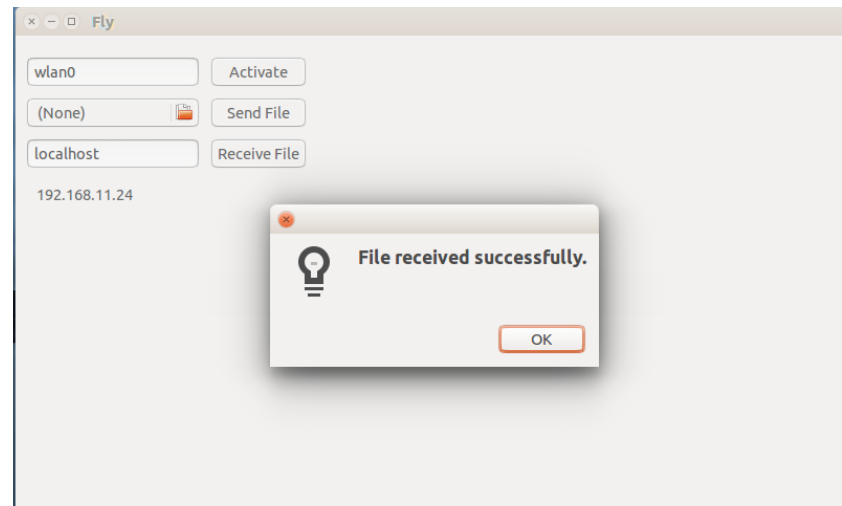

Receiving file

Output

Fly CUI

```
Terminal
deepak[fly]$ ./fly localshot lspci.txt
server: waiting for connection...
server: got connection from 127.0.0.1
file successfully send
```

Fly GUI

Demo: CUI

Receiving File

A terminal window titled "Terminal" with a standard macOS-style title bar (red, yellow, green buttons). The text inside shows a client connecting to localhost and successfully receiving a file.

```
deepak[fly]$ ./fly localhost
client: connecting to 127.0.0.1
file received
deepak[fly]$
```

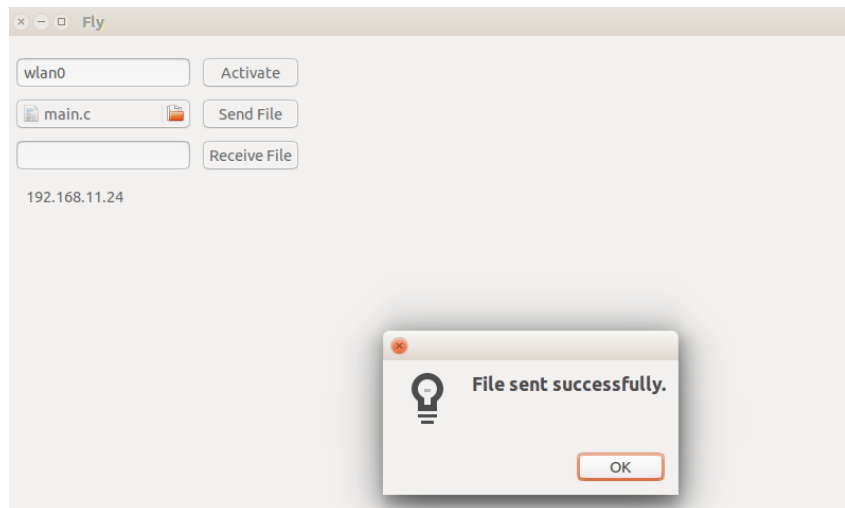

Sending File

A terminal window titled "Terminal" with a standard macOS-style title bar. The text inside shows a server waiting for a connection, receiving one from localhost, and successfully sending a file.

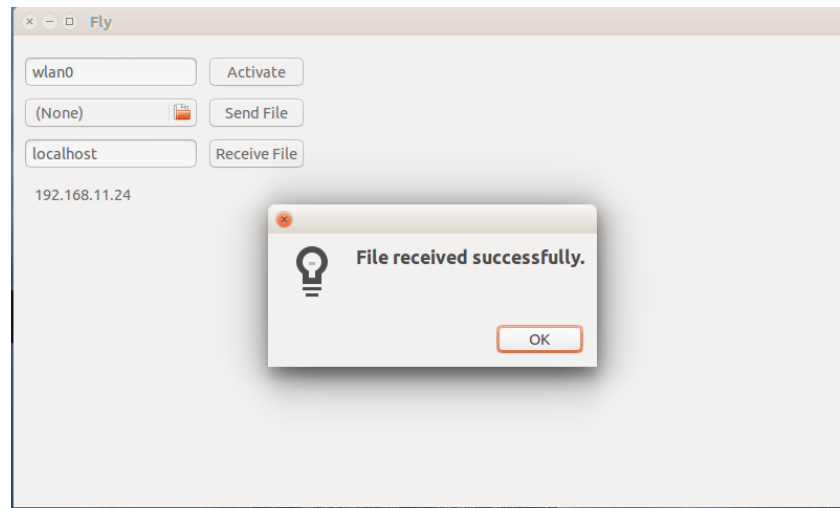

```
deepak[fly]$ ./fly localhsot lspci.txt
server: waiting for connection...
server: got connection from 127.0.0.1
file successfully send
```

Demo: GUI

Sending file

Receiving file

Requirements

- Hardware
 - Wi Fi Direct certified hardware for Group Owner
 - Legacy Wifi or Wifi certified for clients
- Software
 - Machine running Linux alike OS
 - WPA supplicant

Limitations

- The application only works on Linux alike system
- IP needs to be assigned manually
- Character files can only be transferred

Future enhancements

- Implementation of DHCP
- Support across all Operating System
- Transfer of file with any file format
- Establish Wifi Direct connection from fly

Conclusion

- Wifi direct delivers simplicity of Bluetooth and at the same time Bandwidth performance of Wifi
- Although OEM ships with Wifi Direct certification, connecting and sharing contents across different OEM is still difficult
- Wifi is new and emerging technology. It will take some time to commonly use across all devices and become standard

Thank! You
